

F5 SLEDFest 2022

Getting Started w/ an Enterprise Application Strategy

Jamie Lozan

Solutions Engineer, Public Sector

Agenda

Common Challenges with Modern Applications

Where does NGINX Plus Fit

Discovery with Instance Manager

Ingress Controller for K8S

Web App Firewall & L7 DoS

Service Mesh, Observability

Questions?

Common Challenges with Modern Applications

 \mathbf{f}

Customers consistently encounter similar challenges

100% of customers lack visibility

Poor application visibility is a persistent and pervasive issue for all customers

TOP APPLICATION VISIBILITY GAPS

Total number of applications

Where those applications are hosted Whether those applications are secured and compliant End-to-end application-level SLAs (e.g., end-user availability, response times)

ROOT CAUSES OF VISIBILITY GAPS

Heterogenous application portfolio Disparate tools and technologies

Organizational siloes

Insufficient integration and automation

The application data path is the pathway through which application traffic flows to reach an end-user

Application business logic

End-user

Application services sit along the application data path and ensure end-users have secure and reliable access

Application services include capabilities for application security and capabilities for application delivery

Applications use several application services along the data path

Often with each service provided by a different vendor

And a different set of vendors for each application architecture and infrastructure environment

Making end-to-end automation and orchestration expensive, having to stitch everything together

Leaving application owners and operators unable to easily trouble-shoot issues

The F5 portfolio of best-in-class application services substantially reduces complexity and cost

... and improves mean time to resolution

Where does NGINX Plus Fit?

NGINX Plus can Help

NGINX Instance Manager

OVERVIEW

NGINX	Instances Overview				(?)	2
Select module V						
Instance Manager	Hostname	Type	System Tans Status	Last S	ري Refresh ک	, Export

Find and Secure instances

- Scan utilizing stealth ports and tagging
- CVE vulnerability and outdated version information
- Lightweight UI for inventory management
- Certificate Management

Configuration Management

- Reads existing conf files
- Add and remove conf files
- Works with your existing configurations, tools and processes.
- Centralized Validation
- Tagging for role-based access (RBAC)
- Recommendations based on best practices

DevOps friendly

- API First Focus
- Metrics natively and externally available via Clickhouse

Instance Discovery and Scanning

NGINX Pattof FS

Instance Manag

Instances
 Instance Grou

Production-Grade Kubernetes with NGINX

The Ingress Controller

A specialized load balancer for Kubernetes environments:

- Accepts traffic from outside the Kubernetes platform, and load-balances it to pods (containers) running inside the platform
- Configured using the Kubernetes API, with objects called 'Ingress Resources'
- Monitors the pods running in Kubernetes, and automatically updates the load balancing rules if, for example, pods are added or removed from a service

API Gateway

- Centralized logging
- Client authentication
- Fine grained access control
- Load balancing
- Rate limiting
- Request routing
- Request/response manipulation
- Service discovery of backends
- TLS termination

API Breaches

API Security + Application Protection

API1. Broken Object Level Authorization
API2. Broken User Authentication
API3. Excessive Data Exposure
API4. Lack of Resources & Rate Limiting
API5. Broken Function Level Authorization
API6. Mass Assignment
API7. Security Misconfiguration
API8. Injection
API9. Improper Assets Management
API10. Insufficient Logging & Monitoring
